Professional Identity

Full stack developer with strong backend depth across .NET style service design, SQL backed applications, Azure hosted systems, and integration heavy product workflows. Strongest fit is in modular application development, REST APIs, webhook design, tenant level configuration, JSON data mapping, authentication, and cross system debugging. Bring practical value by turning invoice, payment, and operational workflows into reliable application features with clear error handling, traceability, and maintainable handoff documentation.

Role Fit Snapshot

Target Fit: Full stack integration developer comfortable across application code, admin screens, SQL, Azure, and automation workflows.

Product Match: Experience with invoice, payment, seller, healthcare, and operational workflow systems where data must move cleanly between platforms.

Technical Match: C#, .NET patterns, SQL, Azure services, REST APIs, webhooks, OAuth, shared secrets, JSON payloads, background processing, and workflow automation.

Delivery Style: Builds practical features with QA friendly validation, observable failures, secure configuration, and clear setup notes for handoff.

Evidence Highlights

- Improved integration reliability by adding event validation, correlation friendly logging, and clearer failure visibility across webhook and API based flows.
- Reduced manual reconciliation effort by shaping invoice and payment data into predictable payloads for downstream systems and operational review.
- Strengthened tenant aware configuration by separating enablement, credentials, endpoint references, permissions, and workflow behavior from core application logic.
- Improved backend maintainability through modular service boundaries, SQL troubleshooting, API contract cleanup, and deployment ready documentation.
- Supported UAT and QA validation by making create, update, void, delete, and paid status flows easier to reproduce and verify.

Engineering Strengths

- Application Development: C#, .NET, ASP.NET Core patterns, ABP.IO style modular architecture, REST APIs, webhook endpoints, background jobs, service layer design.
- Data and Persistence: SQL, Azure SQL, schema design, query optimization, data troubleshooting, transaction aware workflow updates, invoice and payment data modeling.
- Cloud and Operations: Microsoft Azure, Azure App Services, Azure Functions, Azure Key Vault, Azure Storage, Application Insights, secure configuration, deployment support.
- Integration and Automation: n8n, Zapier style workflows, QuickBooks Online API concepts, third party APIs, JSON mapping, OAuth, API keys, shared secrets, retry handling.
- Frontend and Configuration: Admin screens, tenant settings, feature toggles, permissions, test webhook actions, configuration validation, user friendly operational controls.
- Quality and Traceability: Correlation IDs, structured logs, error visibility, integration observability, QA support, UAT troubleshooting, technical setup documentation.

Work Experience

Senior Software Engineer

Thoughtworks | Los Angeles, CA

02/2023 - Present

- Product and Platform Context: Thoughtworks AI works enterprise API modernization engagement supporting modular service migration, Azure aligned delivery, and integration heavy business workflows.
- Built backend features using C# and .NET service patterns with SQL backed persistence, REST APIs, webhook style communication, and secure configuration boundaries.
- Designed tenant aware settings for integration enablement, endpoint references, authentication metadata, permissions, and environment specific behavior.
- Created admin configuration screens that allowed operations users to manage integration status, validate webhook actions, and review setup issues without engineering support.
- Implemented JSON payload shaping, event trigger handling, shared secret validation, and correlation friendly logging for cross system workflow visibility.
- Worked with Azure App Services, Azure SQL, Key Vault, Storage, and Application Insights to support secure deployment, troubleshooting, and runtime observability.
- Improved integration handoff quality by documenting setup steps, payload expectations, error scenarios, and QA validation paths for client UAT.
- Played a key role in making modernization work more reliable by separating application logic, workflow configuration, and operational diagnostics into maintainable modules.

Senior Software Engineer

Amazon | Los Angeles, CA

04/2020 - 01/2023

- Product and Platform Context: Amazon Selling Partner API finance, tax, and invoicing capabilities supporting seller and vendor invoice data exchange, payment visibility, and bookkeeping workflows.
- Developed backend services with Java, C#, REST APIs, SQL and DynamoDB data access patterns, and event driven processing for invoice and payment related workflows.
- Implemented API contracts, JSON payload validation, authentication handling, and integration failure paths for partner facing financial data operations.
- Worked with AWS Lambda, SQS, CloudWatch, IAM, and secure credential references to support asynchronous processing, retries, and traceable operational behavior.
- Improved invoice workflow reliability by making submission, update, and exception states easier for support and QA teams to reproduce and diagnose.
- Collaborated with product, QA, and partner engineering teams to validate edge cases around invoice creation, voiding, reconciliation, and downstream status updates.

Software Developer

Clearstep | Chicago, IL

11/2018 - 03/2020

- Product and Platform Context: Clearstep AI driven conversational healthcare platform supporting virtual triage, care navigation, and structured workflow routing for patients and care teams.
- Built full stack product features using JavaScript, TypeScript, Node.js, React, REST APIs, and SQL backed application data.
- Supported backend workflow logic for structured intake, routing decisions, status updates, and external system data exchange at an early career level.
- Created internal configuration screens that helped non engineering users adjust workflow behavior, content mappings, and operational rules.
- Worked on JSON payload design, API debugging, authentication handling, and error reporting for healthcare workflow integrations.
- Improved supportability by adding clearer logs, validation checks, and documentation for recurring integration and data quality issues.

Education

University of California, Berkeley	Berkeley, CA
Bachelor's Degree, Computer Science	2014 - 2018
• Participant - ACM International Collegiate Programming Contest (ICPC) • Contributor to open-source campus initiative	

Certifications

- AWS Certified Solutions Architect Associate: Amazon Web Services (2023)
- Certified Kubernetes Application Developer: Cloud Native Computing Foundation (2024)
